

Every Drop Counts

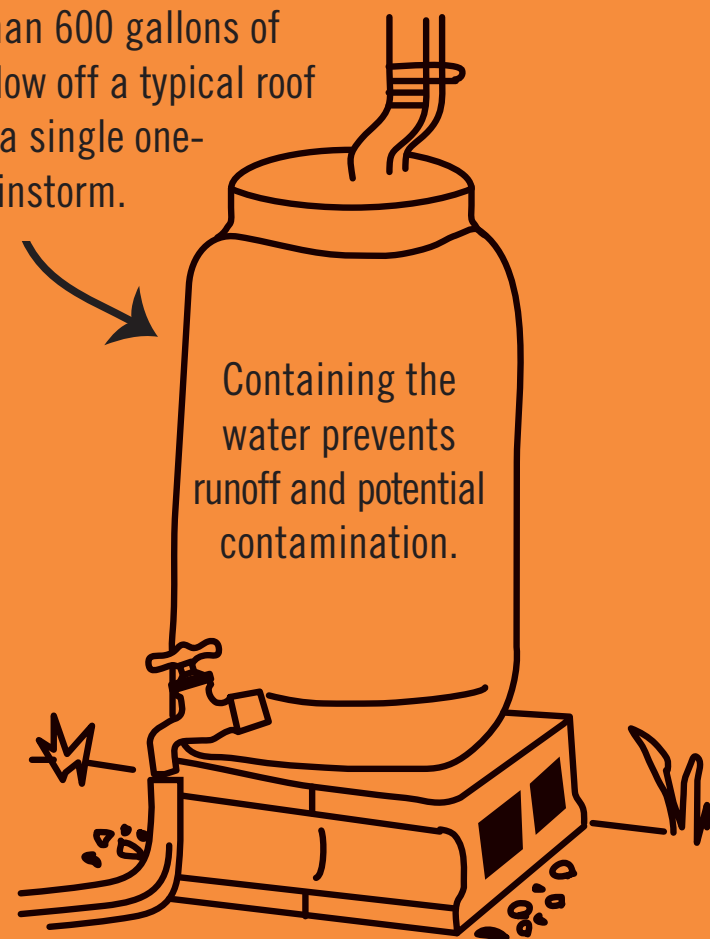

We strive to be water-wise in our garden.

Here are some helpful tips to save water in your own yard!

RAIN BARREL

Rain barrels collect and store rainwater to conserve water from your tap.

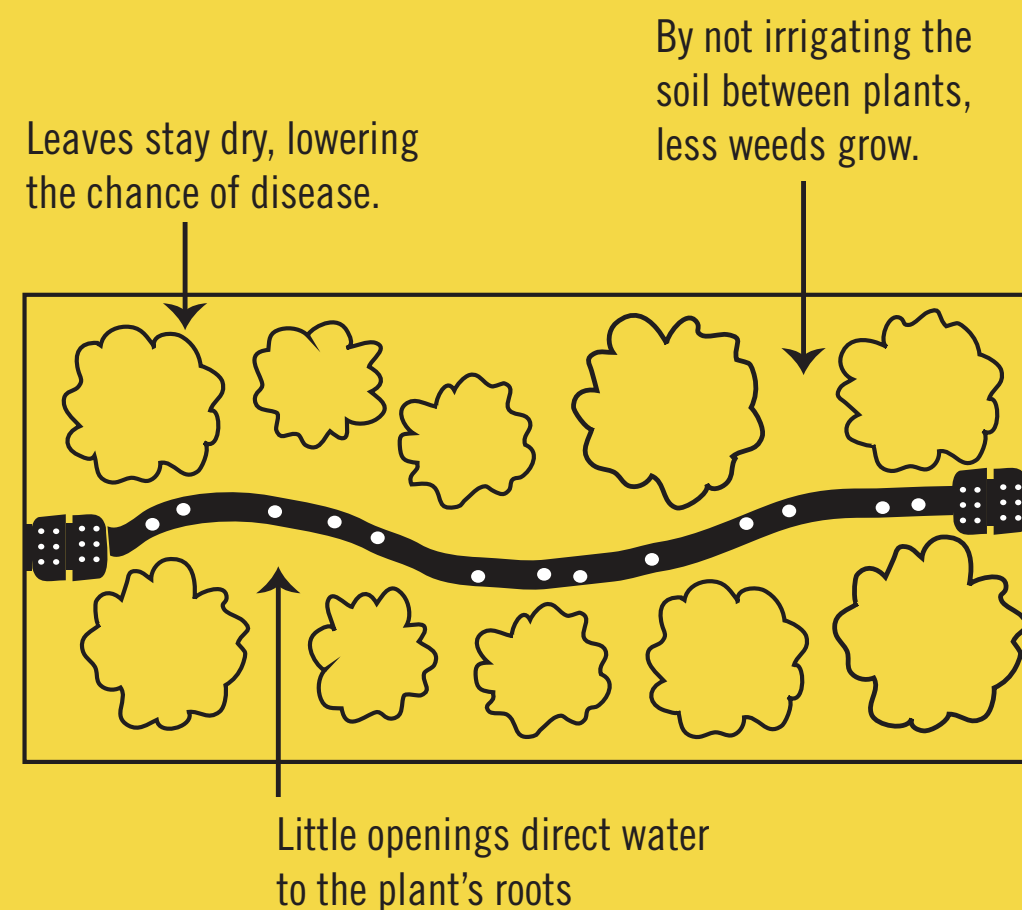

More than 600 gallons of water flow off a typical roof during a single one-inch rainstorm.

Our rain barrel collects runoff from the tool shed's roof and used to water our plants. Consider adding one to your garden!

DRIP HOSE

Sprinklers waste water by unnecessarily watering more than plants, and a lot is lost to evaporation. Instead, try drip irrigation or a soaker hose.

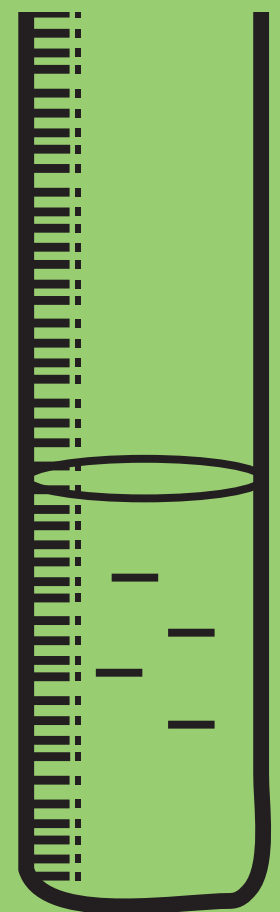

Look for drip hoses throughout this garden.

RAIN GAUGE

Use a rain gauge to measure how much rainfall you're receiving, which determines how much to water your plants.

Water less when rain is abundant.

Be sure to place your gauge out in the open, so nothing blocks the rain from entering.
